IMDb Indexing Exercise

Indexes on real title data

Gregory S. DeLozier, PhD

Real titles. Your own measurements.

Reuse the Chapter 9 Files

Option	What to do
Reuse	Copy `title.basics.tsv.gz` and `title.ratings.tsv.gz` from the Chapter 9 `data` folder
Download again	`curl` both files from `datasets.imdbws.com`

Keep them compressed. Keep them out of git.

Check Your Storage First

Collection	Documents
titles	About 12.8 million
ratings	About 1.7 million

The Free tier is small. Load a subset if it will not fit.

Load First, Index Afterward

```
python3 import-imdb-mongo.py --limit 100000
```

Batches of 10,000. The IMDb id becomes `_id`.

Three Experiments

Experiment	Index it builds
One title by name	`primary_title`
Movies from 1994	`title_type`, `start_year`
Top ten by votes	`num_votes`, descending

```
python3 explore-imdb-indexes.py
```

You Take the Timings

Experiment	Plan	Examined	Time	Build time
Before				
After				

Fill it in for each experiment.

Go Further

Compound index: which field first?

`start_year` alone with a compound index in place.

`/^The Godfather/` against `/Godfather/`.

Top ten with and without `limit`.

Same questions as Chapter 9. Compare the answers.

Clean Up

```
use imdb
db.dropDatabase()
```

The files stay on your computer. Reload any time.
